

Documentation

1. Signup endpoint

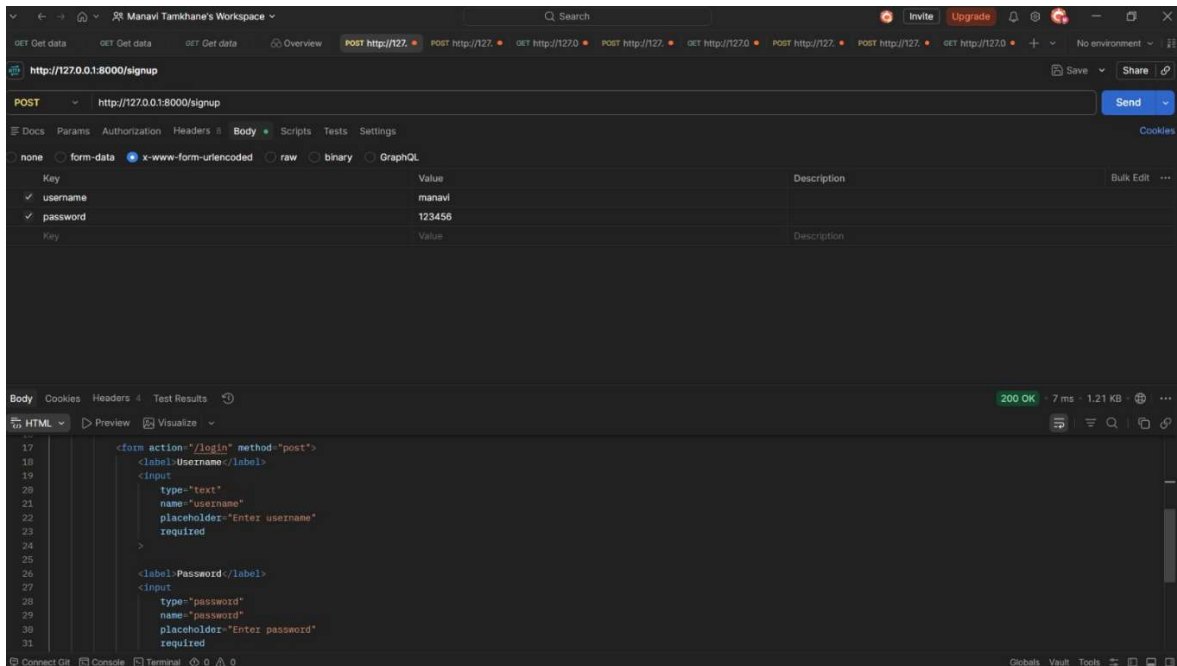

a. GET

Returns the user registration page containing the signup form. This page allows new users to enter their account details and create an account on the platform.

b. POST

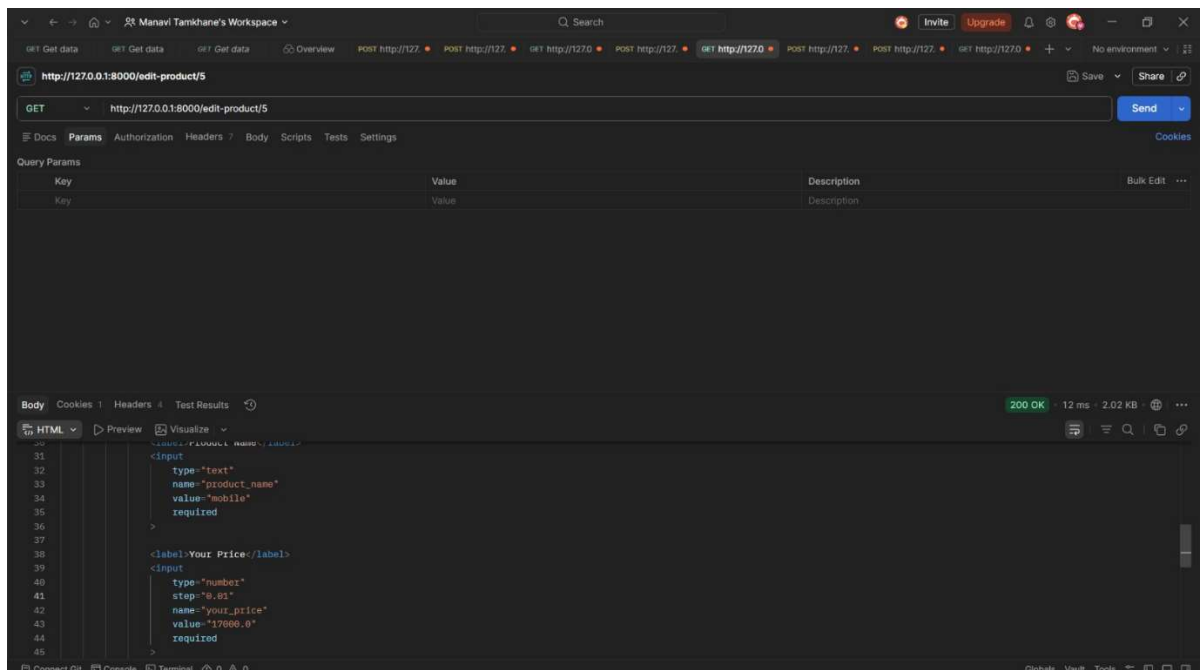

Processes the registration request submitted by the user. The endpoint validates the provided information, securely hashes the password, and stores the new user account in the database.

2. Edit-product endpoint

a. GET

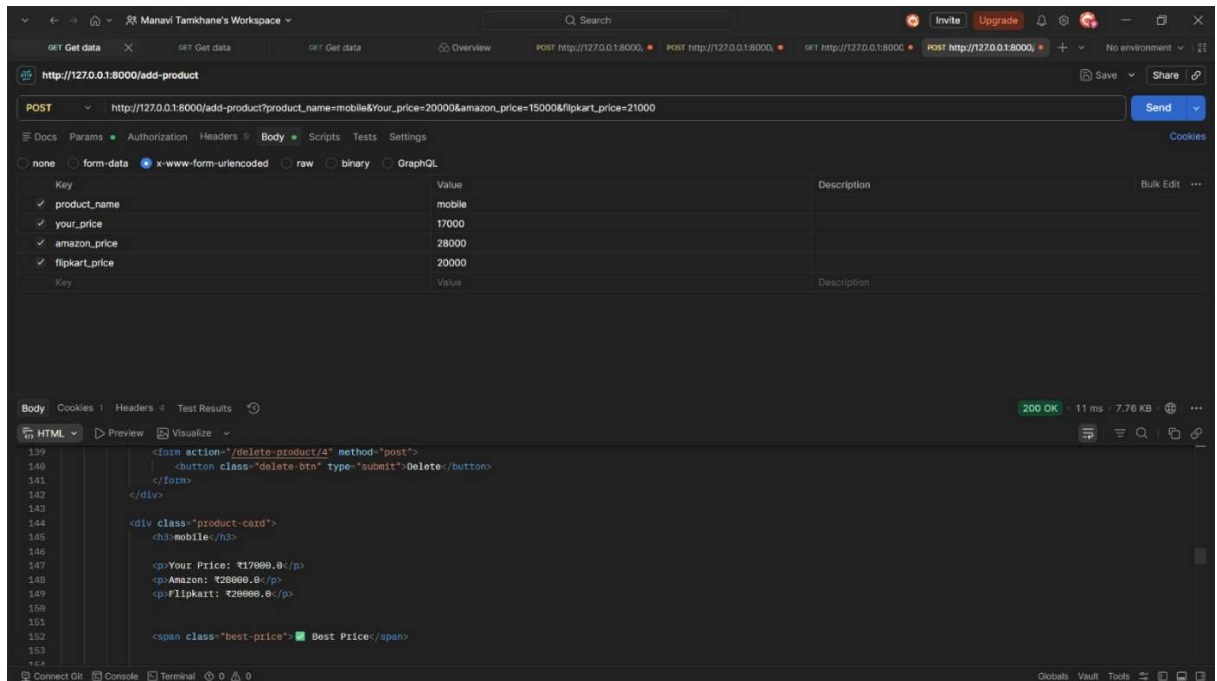

Retrieves the details of a specific product using its unique ID and displays them in an editable form. This enables users to modify existing product information and pricing data.

3. Add-product endpoint

a. POST

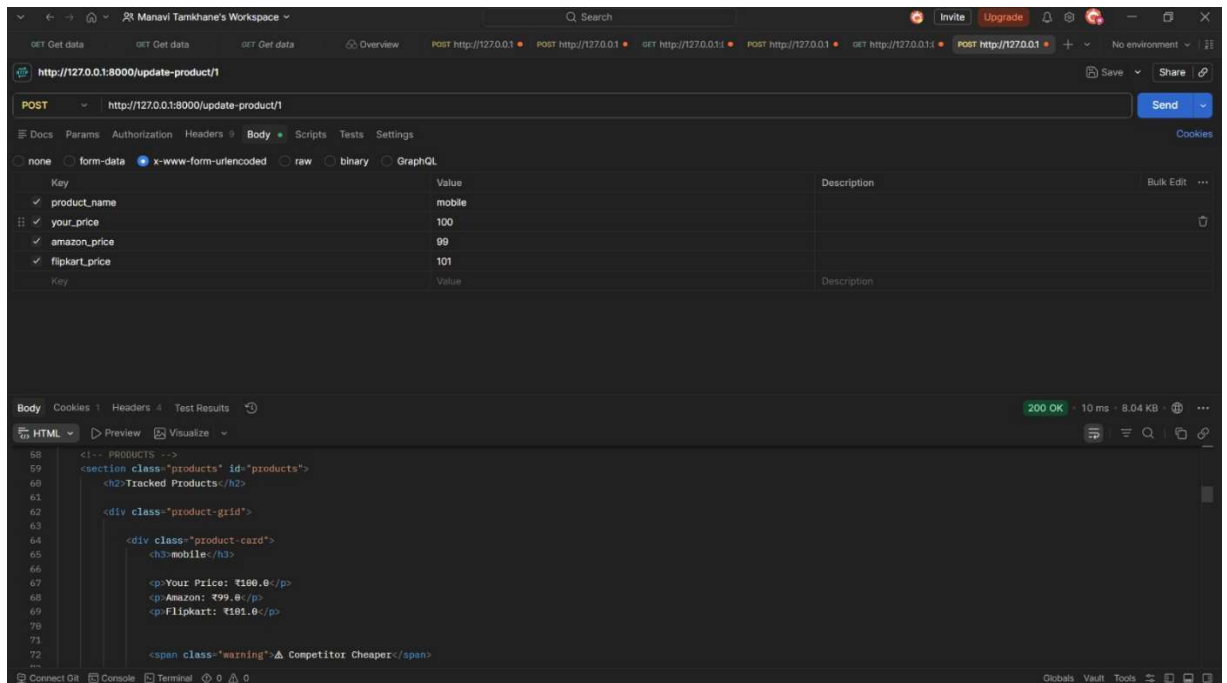

Creates a new product entry in the database. The endpoint accepts product information including product name, user price, Amazon price, and Flipkart price, making the product available for monitoring and analysis.

4. Update-product endpoint

a. POST

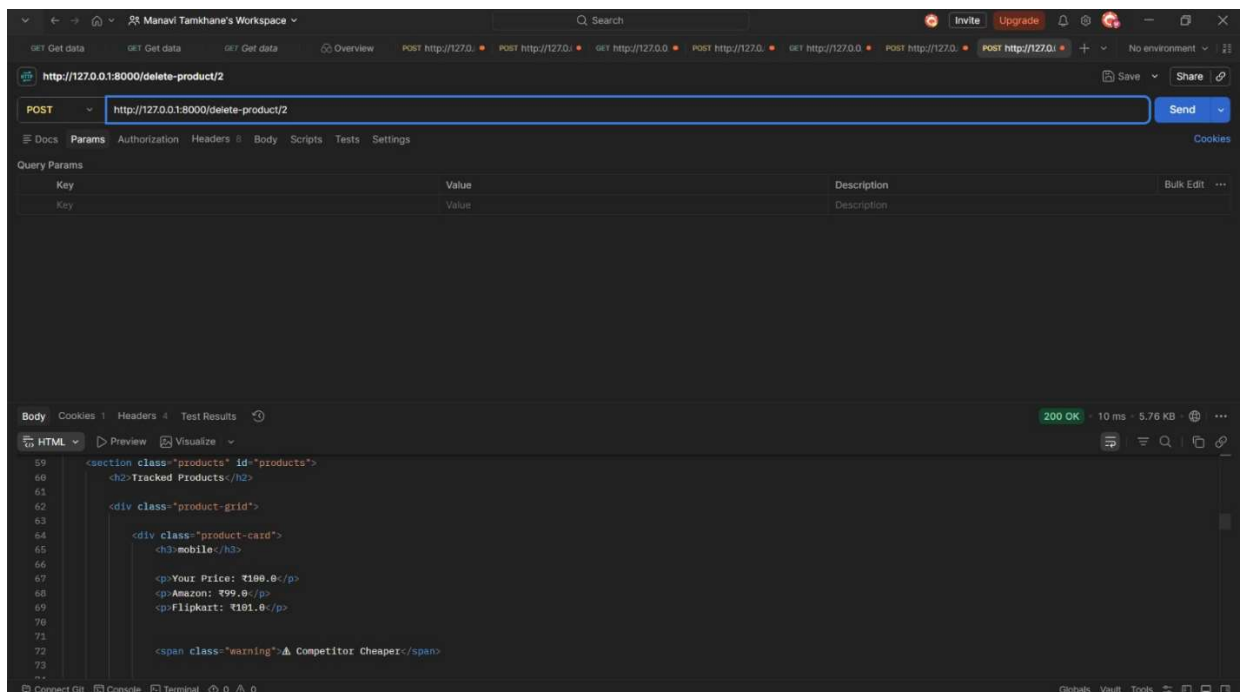

Fetches the current details of a selected product before the update operation. The retrieved information is displayed to the user for modification.

5. Delete-product endpoint

a. POST

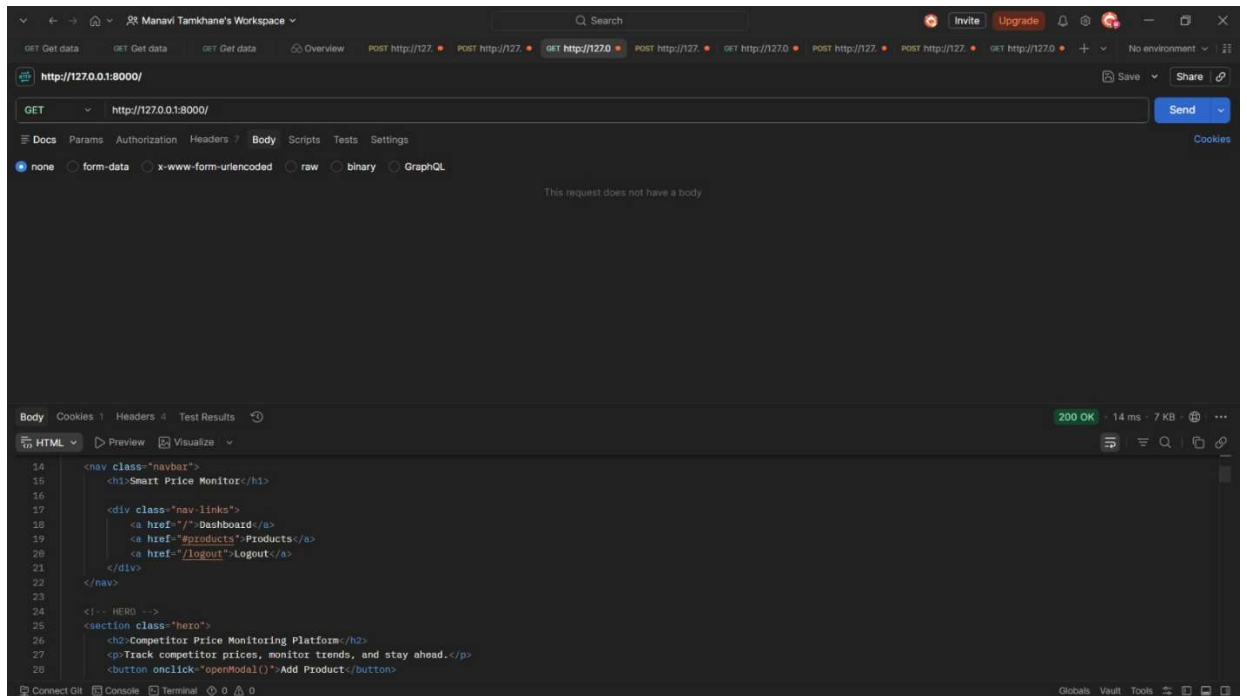

Deletes the selected product from the database using its product ID. Once deleted, the product is removed from the dashboard and monitoring system.

6. Home page

a. GET

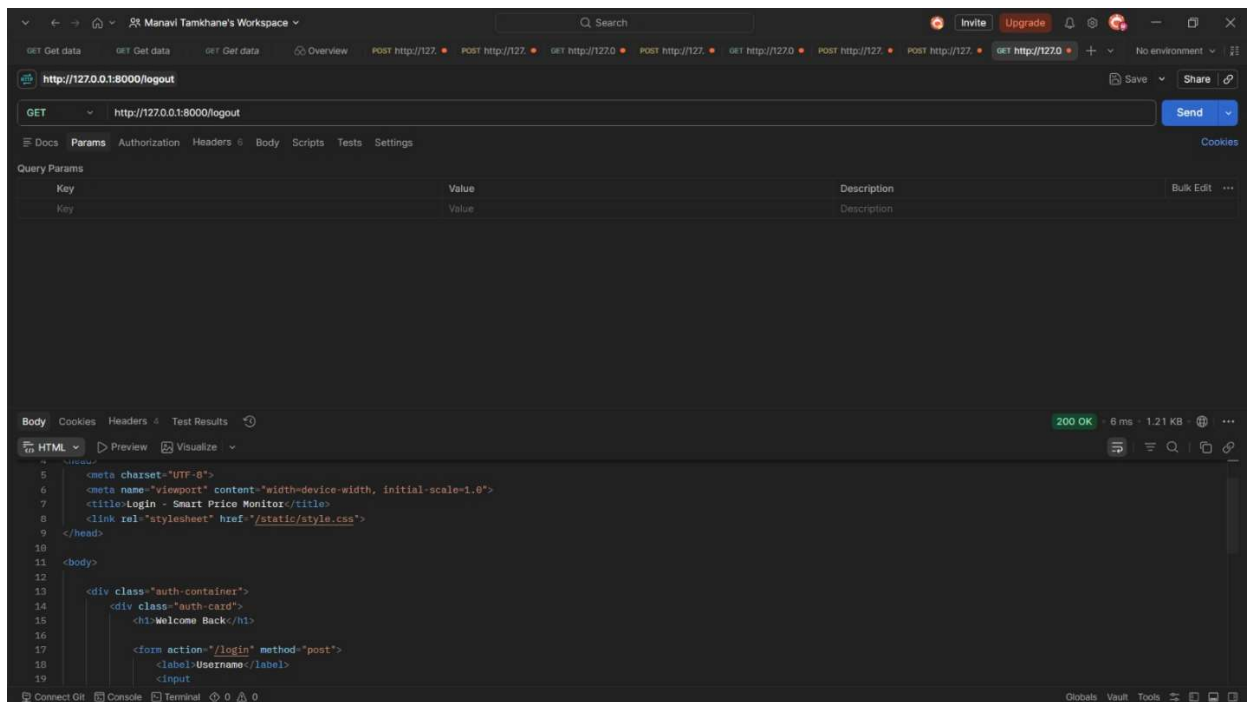

Displays the main dashboard of the application. The dashboard provides an overview of tracked products, competitor prices, product statistics, price monitoring information, and analytics visualizations.

7. Logout endpoint

a. GET

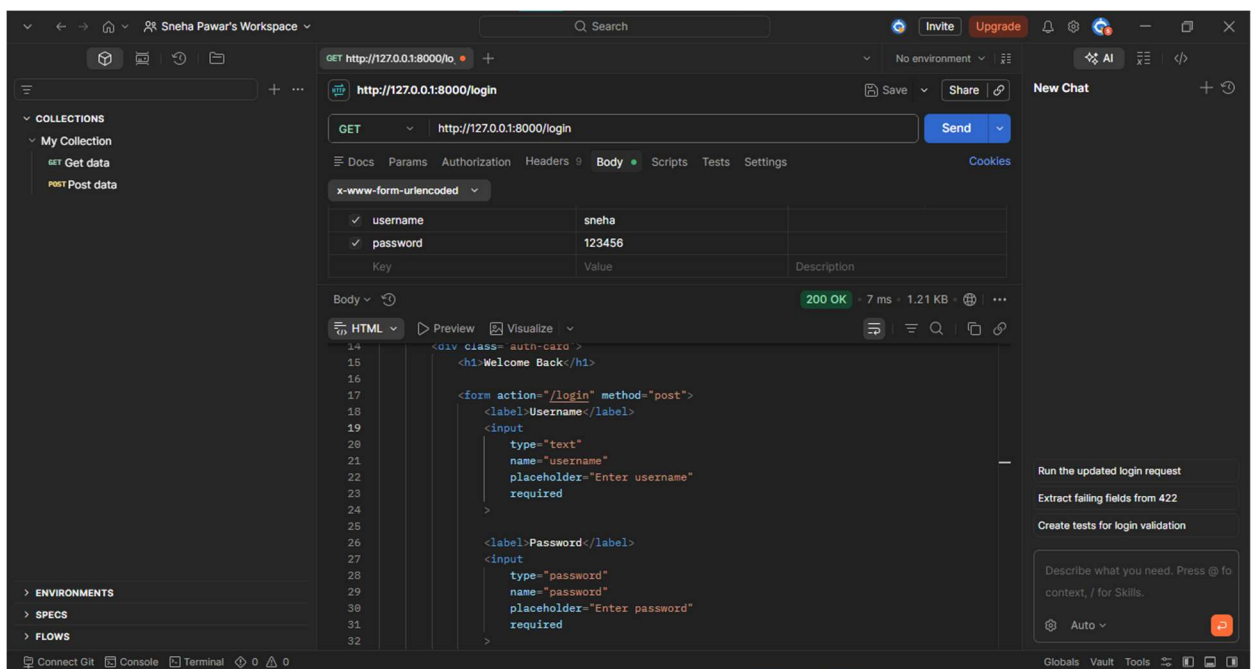

Logs out the currently authenticated user by clearing the active session and authentication data. The user is then redirected to the login page.

8. Login endpoint

a. GET

Returns the login page where registered users can enter their credentials to access the Smart Price Monitor platform.

b. POST

Authenticates the user by validating the submitted username and password. Upon successful authentication, access is granted to the dashboard and protected application features.
